

Carbonflow Connect+ v2.4 Release Notes

We are pleased to announce the release of Carbonflow's Connect+ 2.4!

In response to your requests, we have added process clarity to the Project Map, additional data checks in within Connect+ projects, and Carbonflow now supports VCS and CAR projects.

1 Project Map process clarity

- Additional process clarification in the Connect+ Project Map for authorized users and actions within in each 'swimming lane,' including the addition of a 'Step Group Leader':
 - Step Group Leader functionality provides user organisations with more direct control over which Program Administrators on a project can carry out step actions.
 - After an organisation is defined as Step Group Leader for a step group, only that organisation's Project Admins can perform step actions (e.g. Kickoff, Publish, etc) within that step group.
 - The Step Group Leader for a step group can be edited from the Project Map, and for all step groups from the Project Detail page.

2 Data checking

- Multiple improvements to forms and data checks within various phases of project design and creation.

3 VCS and CAR support

- Program management has been added for the Voluntary Carbon Standard (VCS) and Climate Action Reserve (CAR). These two programs are currently in beta and interested Carbonflow users should contact Support at www.carbonflow.com/support.
- The new programs include full support for key data types, document types, approved verifiers, approved methodologies or protocols, and project work flow.
- Project work flow includes options for early or late validation (VCS) and the use of a new or previously engaged verifier (CAR).
- Methodologies and protocols from both programs are able to be included in CarbonMonitor.
